Motivation: Core-Collapse Supernova Explosion Mechanism

- Nucleosynthesis
 - Heavy element distribution
- Gravitational waves
- Neutrinos
- Nuclear matter

Neutron star!

What Are We Doing?

- Developing new code to study CCSNe: toolkit for **high-order neutrino-radiation hydrodynamics** (thornado)
- 3+1 (CFA)
 - Hydrodynamics
 - Neutrino Transport
 - Gravity
- Runge-Kutta Discontinuous Galerkin (RKDG)

$$\partial_t (\sqrt{\gamma} \mathbf{U}) + \partial_i (\alpha \sqrt{\gamma} \mathbf{F}^i (\mathbf{U})) = \alpha \sqrt{\gamma} \mathbf{S}$$

3+1 GR-Hydro Equations

$$\partial_t (\sqrt{\gamma} \mathbf{U}) + \partial_i (\alpha \sqrt{\gamma} \mathbf{F}^i (\mathbf{U})) = \alpha \sqrt{\gamma} \mathbf{S}$$

Geometry

γ : Determinant of spatial three-metric

α : Lapse function

β : Shift vector

K : Extrinsic curvature tensor

CFA: $\gamma_{ij} = \psi^4 \bar{\gamma}_{ij} \stackrel{\text{sph}}{=} \text{diag} (\psi^4, \psi^4 r^2, \psi^4 r^2 \sin^2 \theta)$

$$K_{ij} = \frac{1}{2} \mathcal{L}_{\mathbf{n}} \gamma_{ij}$$

Extrinsic curvature: describes how the 3D spatial hypersurface is curved in the 4D spacetime manifold

3+1 GR-Hydro Equations

$$\partial_t (\sqrt{\gamma} \mathbf{U}) + \partial_i (\alpha \sqrt{\gamma} \mathbf{F}^i (\mathbf{U})) = \alpha \sqrt{\gamma} \mathbf{S}$$

$$\mathbf{U} = \mathbf{U}(\vec{x}, t), \quad \vec{x} \in [\vec{x}_L, \vec{x}_U], \quad t \in [0, t_f]$$

$$\mathbf{U}(\vec{x}, 0) = \mathbf{U}_0(\vec{x}), \quad \mathbf{U}(\vec{x}_L, t) = \mathbf{b}_L(t), \quad \mathbf{U}(\vec{x}_U, t) = \mathbf{b}_U(t)$$

Evolved Quantities

D : Conserved rest-mass density

\mathbf{S} : Conserved momentum-density

τ : Conserved energy-density

$$D = \rho W$$

$$S_j = \rho h W^2 v_j$$

$$\tau = \rho h W^2 - p - \rho W$$

$$W = (1 - \vec{v} \cdot \vec{v})^{-1/2}$$

$$h = 1 + (e + p) / \rho$$

$$p = p(e) = (\Gamma - 1) e, \quad \Gamma \in (1, 2]$$

3+1 GR-Hydro Equations

$$\partial_t (\sqrt{\gamma} \mathbf{U}) + \partial_i (\alpha \sqrt{\gamma} \mathbf{F}^i (\mathbf{U})) = \alpha \sqrt{\gamma} \mathbf{S}$$

Fluxes

$$F_D^i = (v^i - \alpha^{-1} \beta^i) D$$

$$F_{S_j}^i = P_j^i - \alpha^{-1} \beta^i S_j$$

$$F_\tau^i = S^i - D v^i - \alpha^{-1} \beta^i \tau$$

$$P^{ij} = \rho h W^2 v^i v^j + \gamma^{ij}$$

3+1 GR-Hydro Equations

$$\partial_t (\sqrt{\gamma} \mathbf{U}) + \partial_i (\alpha \sqrt{\gamma} \mathbf{F}^i (\mathbf{U})) = \alpha \sqrt{\gamma} \mathbf{S}$$

Sources

$$S_D = 0$$

$$S_{S_j} = \frac{1}{2} P^{ik} \partial_j \gamma_{ik} + \alpha^{-1} S_i \partial_j \beta^i - \alpha^{-1} (\tau + D) \partial_j \alpha$$

$$S_\tau = P^{ij} K_{ij} - \alpha^{-1} S^j \partial_j \alpha$$

3+1 GR-Hydro Equations

$$\partial_t (\sqrt{\gamma} \mathbf{U}) + \partial_i (\alpha \sqrt{\gamma} \mathbf{F}^i (\mathbf{U})) = \alpha \sqrt{\gamma} \mathbf{S}$$

$$\begin{aligned} & \frac{\partial}{\partial t} \begin{pmatrix} \sqrt{\gamma} D \\ \sqrt{\gamma} S_j \\ \sqrt{\gamma} \tau \end{pmatrix} + \frac{\partial}{\partial x^i} \begin{pmatrix} \alpha \sqrt{\gamma} (v^i - \alpha^{-1} \beta^i) D \\ \alpha \sqrt{\gamma} (P_j^i - \alpha^{-1} \beta^i S_j) \\ \alpha \sqrt{\gamma} (S^i - D v^i - \alpha^{-1} \beta^i \tau) \end{pmatrix} \\ &= \alpha \sqrt{\gamma} \begin{pmatrix} 0 \\ \frac{1}{2} P^{ik} \partial_j \gamma_{ik} + \alpha^{-1} S_i \partial_j \beta^i - \alpha^{-1} (\tau + D) \partial_j \alpha \\ P^{ij} K_{ij} - \alpha^{-1} S^j \partial_j \alpha \end{pmatrix} \end{aligned}$$

Outline

Motivation/Background - CCSNe

Numerical Method

Results

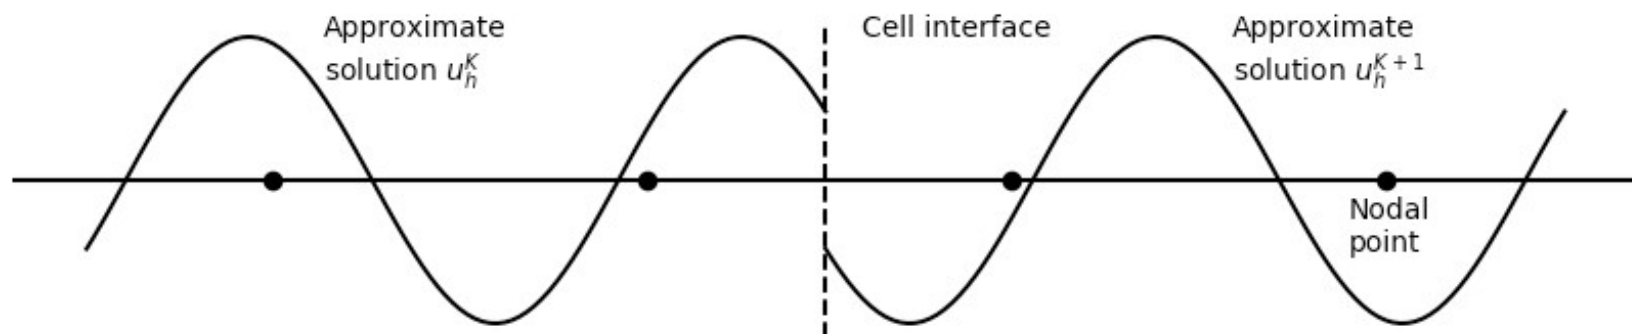

Summary/Future Work

Numerical Method

Discontinuous Galerkin (DG)

- Discretize computational domain
- Locally approximate solution as polynomial
- Use weak form to evolve in time with SSP-RK methods
- Apply slope- and bound-preserving-limiters at each stage of SSP-RK algorithm

$$u(x, t) \approx u_h(x, t) \equiv \sum_{i=1}^N u_h(x_i, t) \ell_i(x)$$

Weak Form (1D)

$$\partial_t (\sqrt{\gamma} \mathbf{U}) + \partial_x (\alpha \sqrt{\gamma} \mathbf{F}(\mathbf{U})) = \alpha \sqrt{\gamma} \mathbf{S} \quad (1)$$

- Multiply (1) by test-function (Lagrange polynomial)

*Assume three-metric explicitly independent of time

$$- \ell_i(x), \quad i = 1, \dots, N$$

- Integrate over element*

$$- dV = \sqrt{\gamma} dx$$

Numerical flux obtained with approximate Riemann solver

- Integration-by-parts on flux term

$$\int_K \frac{\partial \mathbf{U}}{\partial t} \ell_i dV = - \left\{ \left[\alpha \sqrt{\gamma} \ell_i \hat{\mathbf{F}} \right]_{x_L}^{x_U} - \int_K \alpha \mathbf{F} \frac{d\ell_i}{dx} dV - \int_K \alpha \mathbf{S} \ell_i dV \right\}$$

$$\int_K \frac{\partial u}{\partial t} \ell_i dV = - \left\{ \left[\alpha \sqrt{\gamma} \ell_i \hat{F} \right]_{x_L}^{x_U} - \int_K \alpha F \frac{d\ell_i}{dx} dV - \int_K \alpha S \ell_i dV \right\}$$

$$\begin{aligned} \int_K \frac{\partial u}{\partial t} \ell_i(x) dV &= \int_K \frac{\partial}{\partial t} \left(\sum_{j=1}^N u(x_j, t) \ell_j(x) \right) \ell_i(x) dV \\ &= \sum_{j=1}^N \left[\frac{du(x_j, t)}{dt} \int_K \ell_i(x) \ell_j(x) dV \right] \\ &= \sum_{j=1}^N M_{ij} \frac{du_j}{dt} = \mathbf{M} \frac{d\mathbf{u}}{dt}, \quad M_{ij} \equiv \int_K \ell_i(x) \ell_j(x) dV \end{aligned}$$

$$\frac{d\mathbf{u}}{dt} = -\mathbf{M}^{-1} \left\{ \left[\alpha \sqrt{\gamma} \boldsymbol{\ell} \hat{F} \right]_{x_L}^{x_U} - \int_K \alpha F \frac{d\boldsymbol{\ell}}{dx} dV - \int_K \alpha S \boldsymbol{\ell} dV \right\}$$

Time-Stepping Algorithm

Strong-Stability-Preserving Runge-Kutta (SSP-RK)

Cockburn & Shu, (2001) J. Sci. Comp., Vol. 16, No. 3

- Convex-combinations of forward-Euler time-steps

$$\frac{d}{dt}u_h = L(u_h)$$

1. $u_h^{(0)} = u_h^n;$

2. For $i = 1, \dots, N_s$ compute the intermediate functions:

$$u_h^{(i)} = \Lambda \Pi_h \left(\sum_{j=0}^{i-1} \alpha_{ij} w_h^{ij} \right), \quad w_h^{ij} = u_h^{(j)} + \frac{\beta_{ij}}{\alpha_{ij}} \Delta t^n L_h(u_h^{(j)})$$

3. $u_h^{n+1} = u_h^{N_s}$

Slope-limiter

$$\alpha_{ij}, \beta_{ij} > 0, \quad \sum_{j=0}^{i-1} \alpha_{ij} = 1$$

Slope-Limiter

MinMod Limiter

- Higher-order methods can develop unphysical oscillations
- Map solution from nodal to modal representation
- Compare slope in target cell to approximation to derivatives in neighbors via cell-averages

Legendre Polynomials

$$u_h(x, t) = \sum_{i=1}^N u_h(x_i, t) \ell_i(x) = \sum_{n=0}^{N-1} c_n(t) P_n(x)$$

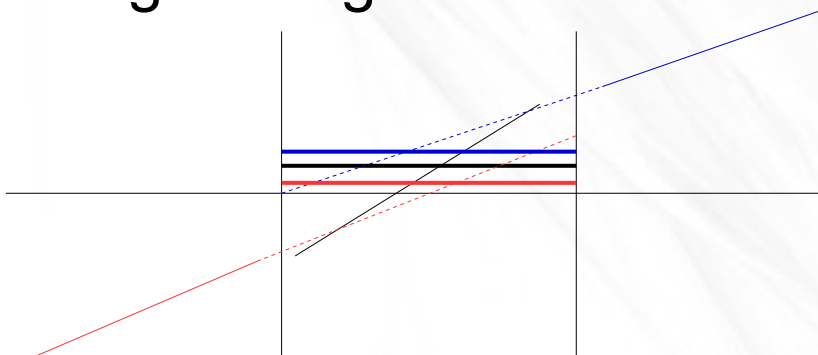

Parameter with value between 1 and 2

$$\tilde{m} = \text{MinMod} \left(\beta_{\text{TVD}} \frac{\bar{u}_K - \bar{u}_{K-1}}{\Delta x}, m, \beta_{\text{TVD}} \frac{\bar{u}_{K+1} - \bar{u}_K}{\Delta x} \right),$$
$$\text{MinMod}(a, b, c) = \begin{cases} 0, & a, b, c \text{ not all same signs} \\ \min(|a|, |b|, |c|), & \text{else} \end{cases}$$

Troubled-Cell Indicator

Fu & Shu, (2017), J. Comp. Phys. 347, 305

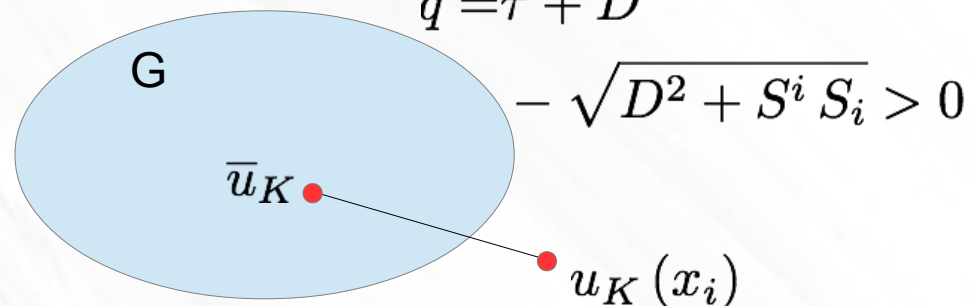

- MinMod limiter activates at smooth extrema
- To alleviate, we detect troubled-cells before applying limiter
- Quantify the difference in solutions in neighboring cells
- Extrapolate solution in neighboring cells into target cell
- Compute cell-averages
- Compute magnitude of differences between extrapolated solution and cell-average
- Compare value to parameter set at run-time

Bound-Preserving Limiter

Qin et al., (2016), J. Comp. Phys., 315, 323

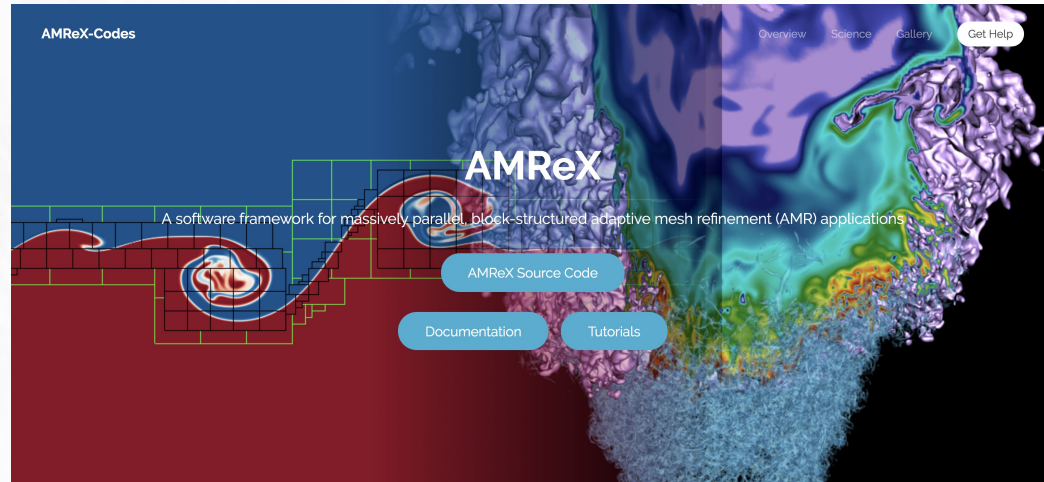

- Higher-order methods can exceed physical bounds
 - $P < 0$
 - $\rho < 0$
 - $|v| > c$
- Define (convex) “set of admissible states”, G
- Leads to two conditions:
 - $D > 0$
 - $q = \tau + D$
 - $-\sqrt{D^2 + S^i S_i} > 0$
- Cell-average is guaranteed to be physical, but **all** quadrature points need to be physical
- Damp point-values towards cell-average (allowed because of CFL condition)

AMReX

<https://amrex-codes.github.io/amrex/>

- Parallel/AMR framework developed primarily from Lawrence Berkeley National Laboratory
- Block-Structured AMR

Outline

Motivation/Background - CCSNe

Numerical Method - RKDG

Results

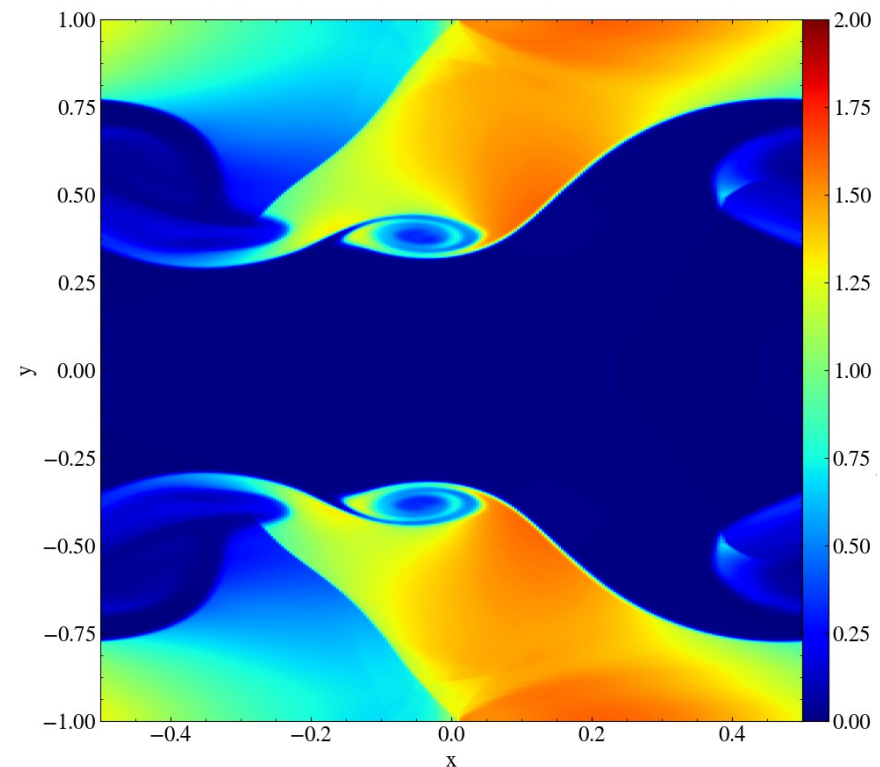

Summary/Future Work

Relativistic Kelvin-Helmholtz Instability

Radice & Rezzolla, (2012), A&A, 547, A26

- Smooth solution
- Turbulent regions*
- 256 x 512
- Third-order method
- SSP-RK3
- Periodic boundary conditions
- HLL Riemann solver
- Characteristic Limiting
- Run with AMReX

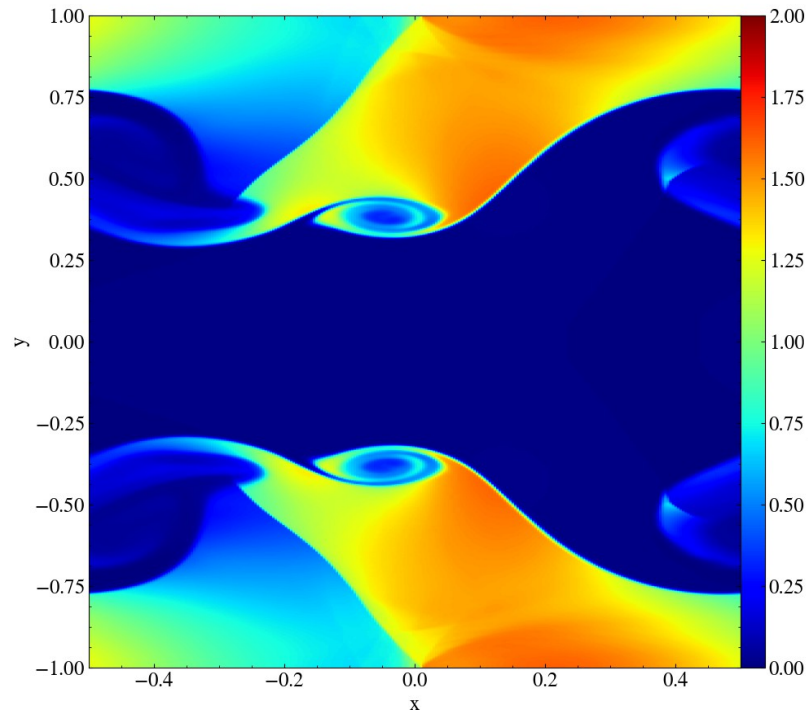

Primitive Mass-Density

* Assuming ideal EOS

HLL vs. HLLC Riemann Solvers

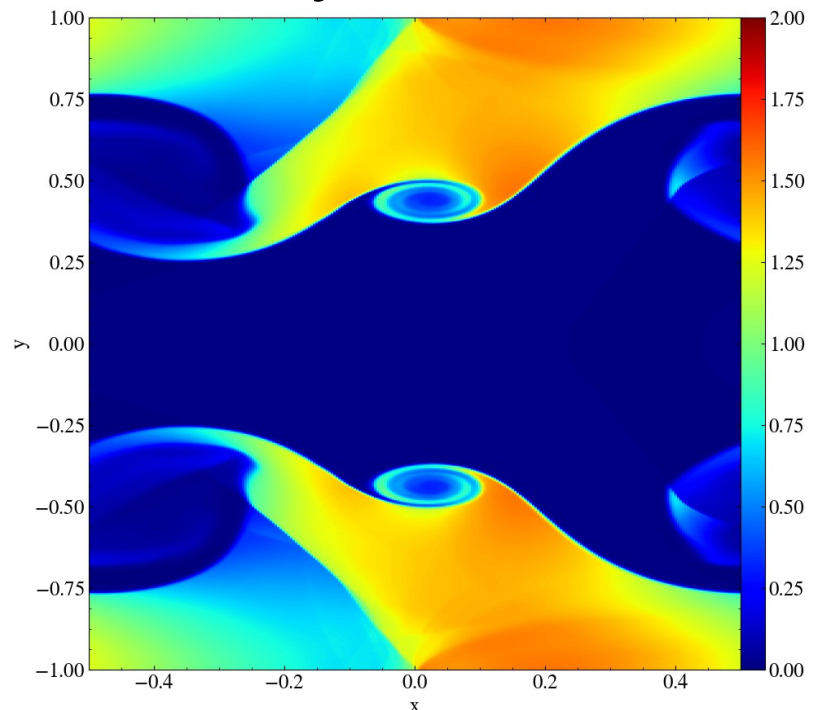

Primitive Mass-Density

HLL

Approximates
Riemann fan with
only two waves

$nX = 256$
 $nY = 512$
 $nNodes = 3$
SSP-RK3

HLLC

Approximates Riemann fan with
two waves and one contact wave
Mignone & Bodo (2005),
MNRAS, 364, 126

2D Riemann Problem

Del Zanna & Bucciantini, (2002), A&A, 390, 1177

- Highly relativistic
 - $W \sim 7$
- Contact waves
- 512×512
- Homogeneous boundary conditions
- HLL Riemann solver
- Component-wise limiting
- Run with AMReX

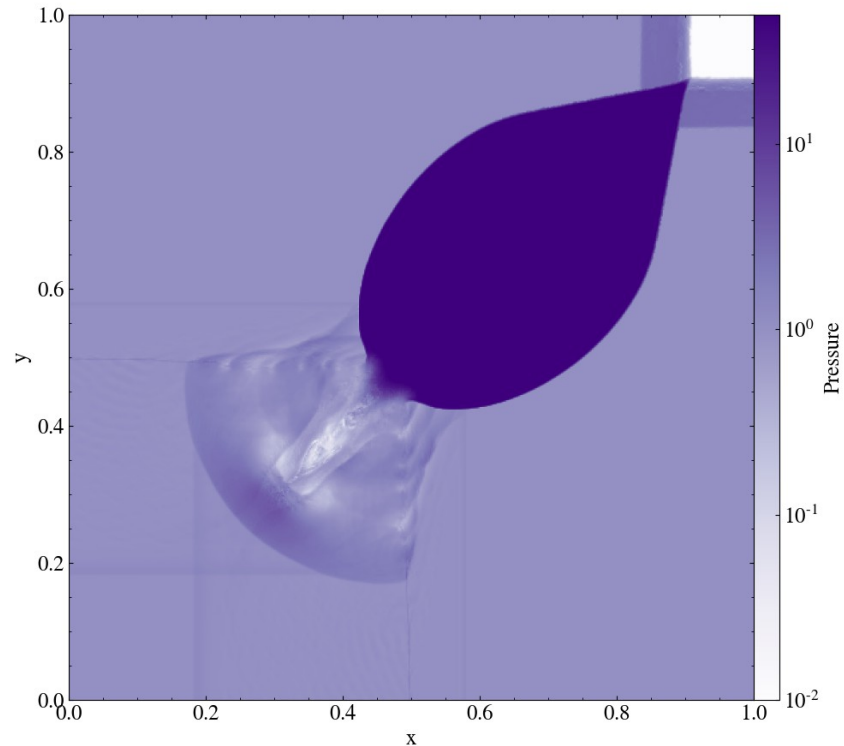

Pressure

2D Riemann Problem

Del Zanna & Bucciantini, (2002), A&A, 390, 1177

- Highly relativistic
 - $W \sim 7$
- Contact waves
- 512×512
- Third-order method
- SSP-RK3
- HLL Riemann solver
- Component-wise limiting
- Run with AMReX

Pressure

Characteristic Limiting

Pressure

Component-Wise Limiting

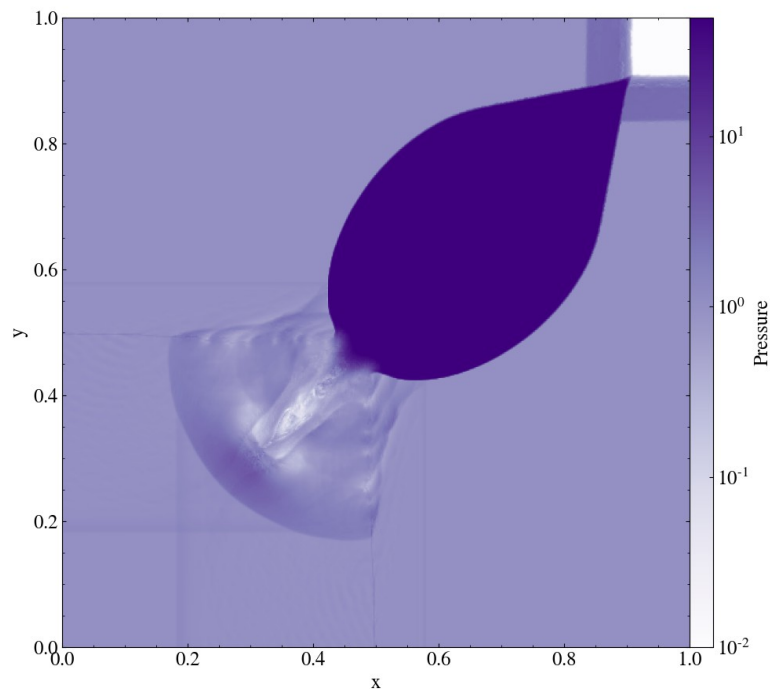

Characteristic Limiting

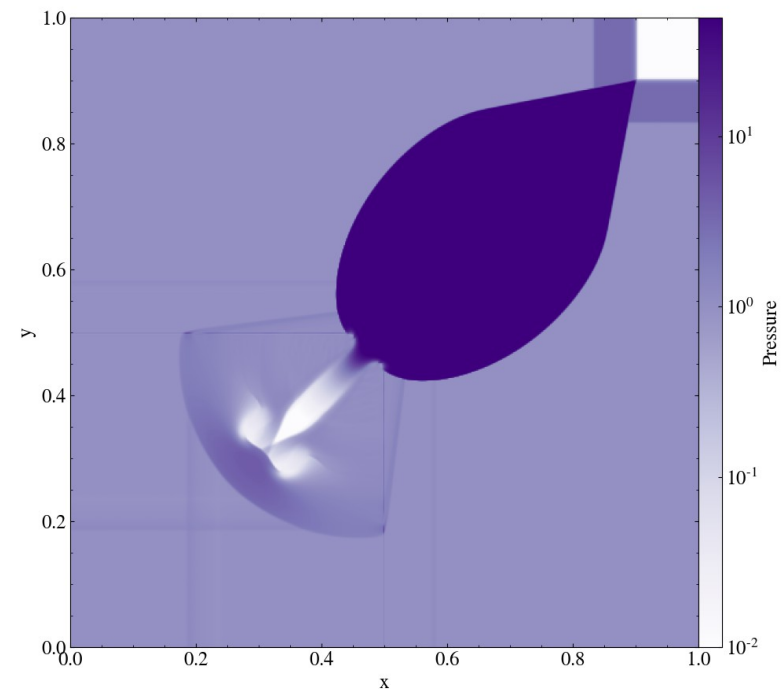

$nX = nY = 512$
 $nNodes = 3$
SSP-RK3

Characteristic Limiting

Pressure

Component-Wise Limiting

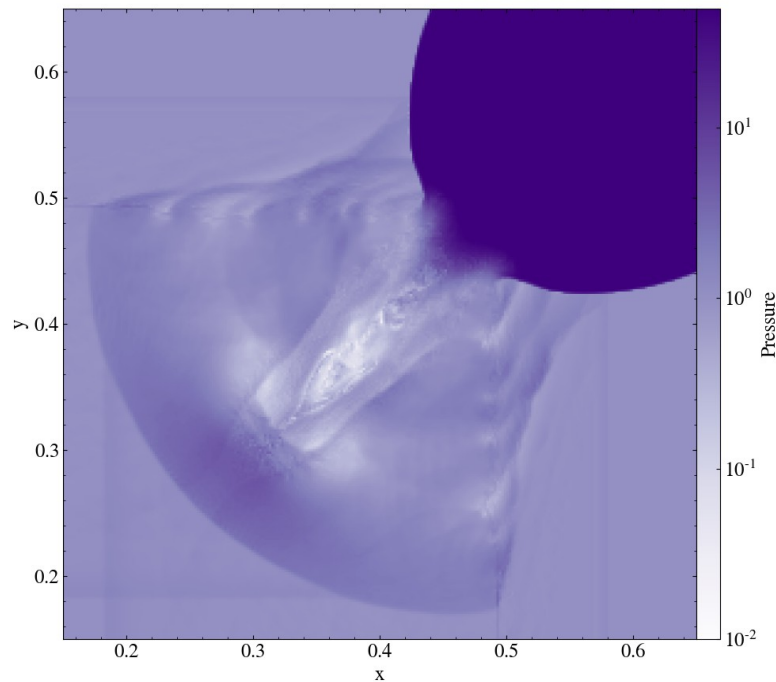

Characteristic Limiting

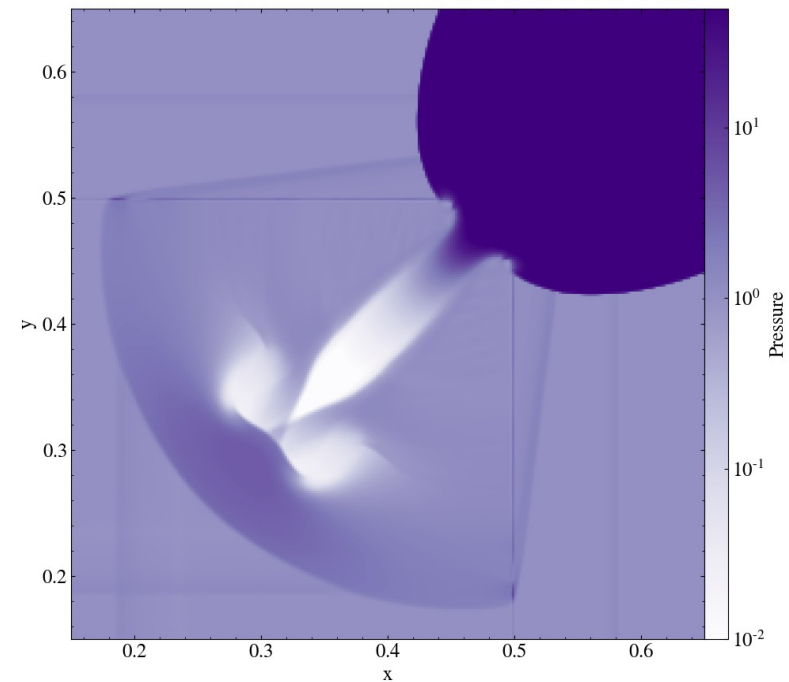

$nX = nY = 512$
 $nNodes = 3$
SSP-RK3

Characteristic Limiting

Pressure

Component-Wise Limiting

Characteristic Limiting

$nX = nY = 512$
 $nNodes = 3$
SSP-RK3

2D, Non-Relativistic SASI

- Physically motivated
- Curvilinear coordinates
- Point-mass gravitational potential
- Perturbed with $\ell = 1$ mode instability
- 256x128
- Third-order method
- SSP-RK3

Mass-Density

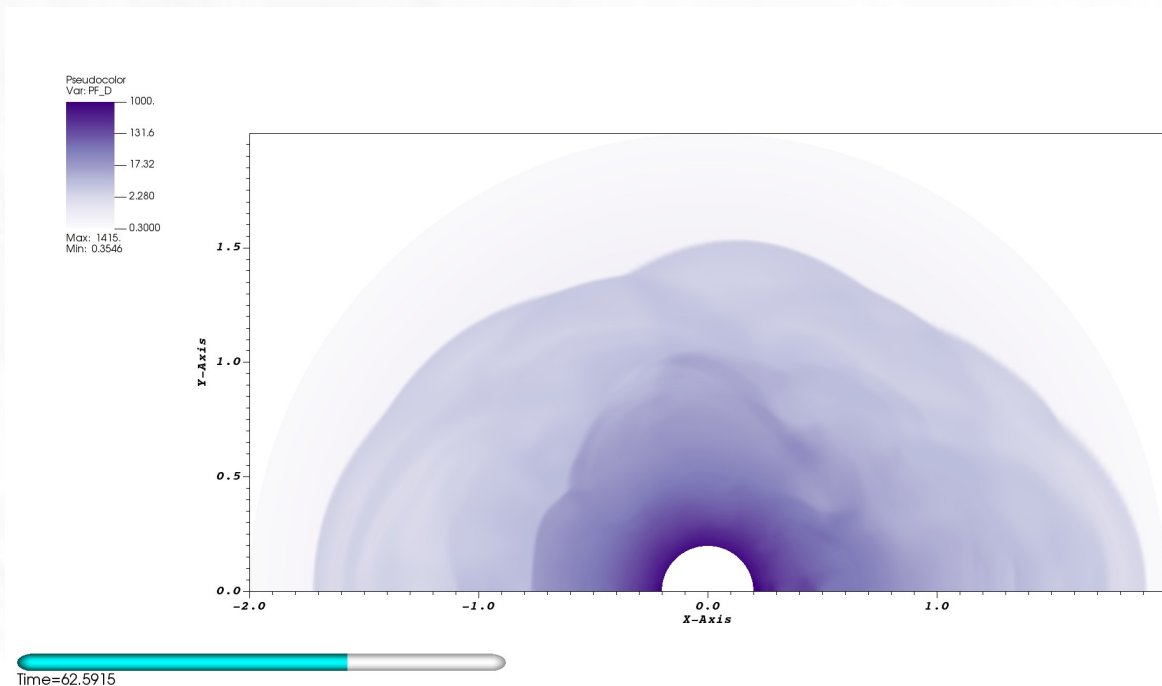

- Run with AMReX

2D, Non-Relativistic SASI

- Physically motivated
- Curvilinear coordinates
- Point-mass gravitational potential
- 256x128
- Third-order method
- SSP-RK3

Mass-Density

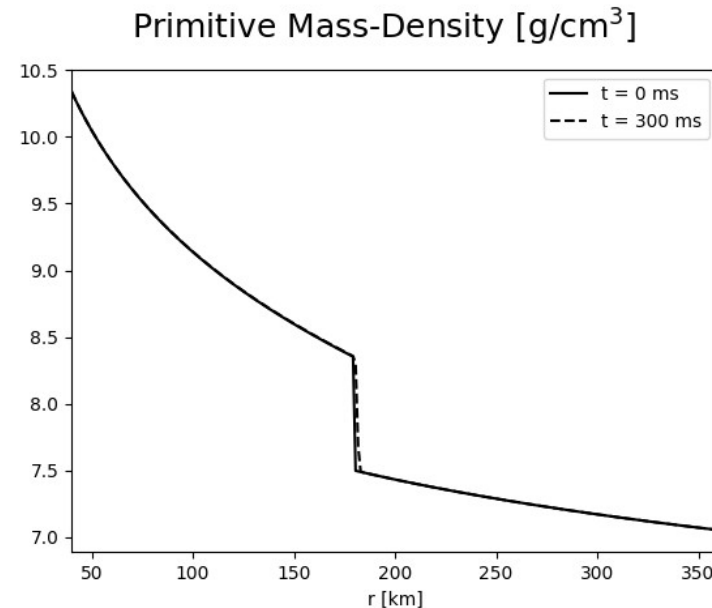

• Run with AMReX

GR Standing Accretion Shock

- Physically-motivated
 - Curvilinear coordinates
 - Stationary background spacetime
 - 256 elements
 - Third-order method
 - HLLC Riemann solver
 - Characteristic-limiting
 - Run with AMReX
- 
- Evolved over several characteristic SASI development timescales

GR Standing Accretion Shock

- Physically-motivated
- Curvilinear coordinates
- Stationary background spacetime
- 256 elements
- Third-order method
- HLLC Riemann solver
- Characteristic-limiting
- Run with AMReX

- Evolved over several characteristic SASI development timescales

Outline

Motivation/Background - CCSNe

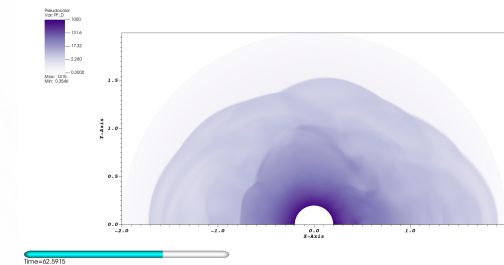

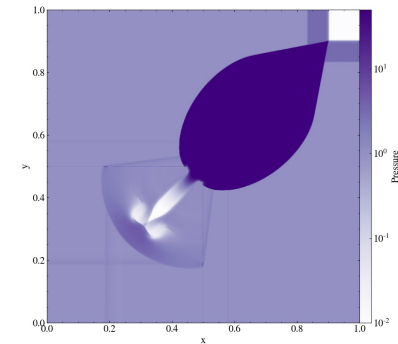

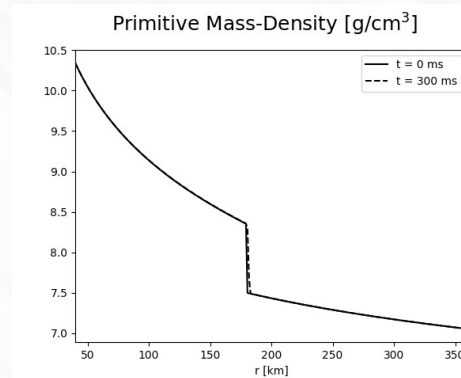

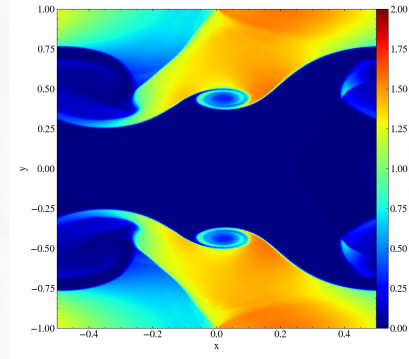

Numerical Method - RKDG

Results – KHI/2DRP/SASI/GR-SAS

Summary/Future Work

Summary

- Developing Multi-D DG-GR Hydro solver
- Implemented characteristic slope-limiting
- Implemented bound-preserving limiter
- Incorporated AMReX
- Successfully run several difficult test problems

Future Work

- MPI scaling tests
- Implement and test 3D components
- Run 2D and 3D, GR-SASI problem
 - Investigate effects of GR-hydro
- AMR
- Couple with CFA gravity solver (Nick Roberts)
- Couple with neutrino-transport solver (Ran Chu, Zach Elledge)
